

# MultiSurf/SurfaceWorks Network License Instructions

---

There are two install files. One for the Server, and the other for the Clients. If the server needs to run MultiSurf, both install files should be used.

## Server:

**32 bit:** [http://aerohydro.com/test/RLM\\_Server32.exe](http://aerohydro.com/test/RLM_Server32.exe) OR

**64 bit:** [http://aerohydro.com/test/RLM\\_Server64.exe](http://aerohydro.com/test/RLM_Server64.exe)

1. Download the appropriate installation file for the OS on your server.
2. Run the install file which will create a sub-folder "AeroHydro\License Info" in your \Users\AppData folder and copy some files. If a different location is desired, you will be prompted in the process for any change you require.
3. The install creates an RLM Server and installs it as a service. The service is started after the process.
4. Created in the previous step is a file called 'hostid.txt' in your C:\Temp folder.
5. Send the "hostid.txt" file to AeroHydro so it can be used to generate your permanent license file.
6. Go to this address on your browser: [http://<COMPUTER\\_NAME>:5054](http://<COMPUTER_NAME>:5054) to open the Server Admin Page. Bookmark this address.
7. A license file will be returned with further instructions for the server and clients.
8. That should be it for the server.

## Now on to the client machine.

**32 bit:** [http://aerohydro.com/test/multisurf82\\_376\\_x86.exe](http://aerohydro.com/test/multisurf82_376_x86.exe) OR

**64 bit:** [http://aerohydro.com/test/multisurf82\\_376.exe](http://aerohydro.com/test/multisurf82_376.exe)

1. Download and Install MultiSurf.
2. MultiSurf should run in evaluation mode for 21 days.
3. Included with a new license file for the server, will be an additional file for the client. Please place this file in the MultiSurf/SurfaceWorks application folder.
4. Open `ahi_client.lic` in Notepad.
5. Change the 'localhost' server name to the name of your server.
6. Save the file and MultiSurf/SurfaceWorks should open as a client.
